ACADEMIC EARLY WARNING SYSTEM

Board Presentation Script

Card 12 | Presentation preparation

Suggested walkthrough. Replace names, dates and results with actual information. No member-number codes are used.

Opening - group representative

Our project is the Academic Early Warning System. It supports academic monitoring and early intervention through instructor, AMU staff, administrator and student workflows. Our QA board organizes the tasks needed to verify the system.

Show board organization

Our lists are Backlog, To Do, In Progress, Testing and Completed. They show actual task progress. Each card has an assigned member, due date, description and checklist. Labels identify the testing category, comments record progress and attachments contain supporting documents or evidence.

Open an upload-testing card

This card tests class creation and academic uploads. We check correct student matching, valid and invalid files, duplicates and stored values. Here are the assigned member, due date, checklist and attached test procedures. Our recorded results are [state actual results].

Explain AEWS-specific QA

We test whole-midterm referral boundaries separately from model risk predictions. We check AMU prediction prerequisites and correct student linkage in assessments and support routing. We test role and ownership restrictions, including server-side requests.

Explain schedule and defects

Our milestones are reviewed test plan, completed test cases, execution results, bug fixing/retesting and final review. Failures receive a bug record. Fixes are retested and affected workflows are checked again.

Close with real status

As of [date], our testing status is [actual counts]. Remaining issues are [actual issues]. Our review decision is [actual decision] based on [evidence]. Each member submits the public board link and screenshot individually.

Practice questions

Why these lists? They make work status visible.
How do you prove completion? Reviewed outputs and actual evidence.
Is referral the same as ML High Risk? No; assess the business rule and inference separately.
How accurate is the model? State verified evaluation results and limitations, or say evaluation is pending.
What if tests fail? Log, assign, fix, retest and review readiness honestly.
